Call to Action from the First Global Forum on Heat and Health

December 2018 / Hong Kong, China
Call to Action

The First Global Forum on Heat and Health (Hong Kong, China, 17-20 December 2018) brought together over 120 interdisciplinary experts and practitioners from 33 countries to formally launch the Global Heat Health Information Network and inform a global common action agenda for heat risk management.

This international Forum enabled participants to share experiences, identify priorities for action, and strengthen interdisciplinary cooperation that can build the capacity of governments, organizations, and professionals to protect populations from the avoidable health risks of extreme and ambient heat.

At the Forum, experts confirmed the challenges that extreme heat poses in all world regions, and that heat-related deaths are largely preventable.

About the Global Heat Health Information Network (GHHIN)

GHHIN is an independent, voluntary, and member-driven forum of scientists, practitioners, and policy makers focused on enhancing and multiplying the global and local learning regarding resilience-building for heat health.

The network is led by the World Health Organization (WHO) and World Meteorological Organization (WMO) Joint Office for Climate and Health and the United States National Oceanic and Atmospheric Administration (NOAA), in partnership with health and meteorological practitioners and scientists from all populated continents.

www.ghhin.org
Heat stress is a serious and urgent health threat for humans. It is a leading cause of weather-related death, and can result in permanent damage to the brain, central nervous system, and other internal organs exacerbating cardiovascular, respiratory, and psychological distress, injuries, and infectious disease.

Extreme heat waves are disasters. Similar to hurricanes, tsunamis, and earthquakes, they can result in significant mortality and morbidity, as well as economic damages and destruction of property that can overwhelm response systems. Dangerous heat conditions can also manifest during heat spells outside the hot season, prolonged periods of locally relevant elevated daytime and night time thermal conditions, and in specific microclimates.

Heatwaves are increasingly accompanied by cascading environmental or socio-economic impacts from heat triggered wildfires and drought to food, energy, water, and transport infrastructure failures. The true global scale and magnitude of the impacts of heat on society are recognized to be under-reported and underestimated.

All populations are affected by rising ambient temperatures. However, some populations are more vulnerable to heat stress and increased risk of death or illness due to a combination of high exposure, physiological preconditions and socioeconomic status. These include the rural and urban poor, populations in regions that are already very hot and humid, regions with colder climates that are facing warmer summers, older adults, infants and children, pregnant women, indoor and outdoor labourers, athletes, attendees of outdoor events, and those with some pre-existing medical conditions.

Occupational heat strain directly affects workers’ health. Impacts include elevated risk of dehydration, kidney disease, work accidents, and lost work productivity. Heat may be indirectly influencing global health in significant ways, as the loss of productivity and income hinders individual ability to live healthy and productive lives.

Urban environments magnify heat exposures. This is due to dense and vertical constructions, extensive use of heat retaining materials, limited vegetation cover, and heat generation from energy use in cooling and transport, that all contribute to urban heat island effects. Urban Heat Islands, and micro-heat islands within cities, increase exposure risk to local inhabitants.

The mental health impacts of heat are an emerging area of interest. Heat influences brain functioning and behaviour, and people with mental health issues and/or prescribed medications which limit the body’s natural cooling functions are especially vulnerable. Social connectivity is important for risk reduction.

Heat-related problems are destined to increase for decades to come. This is due to greenhouse gases already in the atmosphere that are rapidly warming the earth’s climate. The degree and rate of future warming and impacts beyond 2100 will depend on the success of climate change mitigation efforts. Taking appropriate action and preparedness to face a warming world is imperative and urgent.

Key Messages

Extreme heat poses challenges in all world regions, and heat-related deaths are largely preventable.
Solutions

Global expertise and response capacity exists, and is improving in multiple critical domains to provide necessary solutions.

Prevention
Detrimental impacts of extreme heat can be markedly reduced if appropriate strategic planning, early warning systems, public preparedness, urban design and engineering solutions, legislation, and health interventions that focus on prevention are effectively implemented.

Information and solutions should be derived and applied across the broad range of disciplines, time scales, and actors already making important strides to manage heat risks.

Preparedness
Seasonal and sub-seasonal preparedness, complemented by short-term heat early warning systems, are key components of heat action plans, health interventions and emergency response actions.

All well-functioning action and alert systems rely on strong cross-disciplinary and multi-agency collaboration, with effective communication between stakeholders including national and local governments, universities, media, healthcare and social protection systems, NGOS and humanitarian actors, as well as, affected populations.

Location and context specific risk management
Epidemiological studies, social science, risk assessment and heat forecasting capabilities are fundamental to incorporate the differentiated needs of vulnerable groups into risk planning, and to inform appropriate and effective responses.

Multi-disciplinary understandings of the risk context and perceptions are critical to effective intervention design.

Development planning
Strategic and environmentally sustainable urban and rural development planning that accounts for energy-efficient technical and biophysical solutions are essential for long-term heat risk management.

This includes cost-effective improvements to the built environment, especially housing and building design.
Challenges
Common challenges requiring investment include:

**Inadequate recording and monitoring of heat risks and impacts**
This limits research and underlies an insufficient awareness and appreciation of the urgency and magnitude of the cumulative and systemic impacts of extreme heat on people, society, health, wellbeing, and local economies; the complex dependencies and risks of cascading system failures; and the concomitant risks of poor air quality, drought, water stress, and poorly planned urbanization that all place society at greater risk.

Further investment in monitoring and evaluation capabilities, including meteorological observations, health surveillance of heat-related mortality and morbidity, and other measures such as impacts on productivity, worker safety, and economics are imperative to improve our understanding of vulnerability and how short and long-term prevention can be strengthened.

**Inadequate access to appropriate tools and information**
Low levels of preparedness and planning are compounded by inadequate availability and access to appropriate tools and information to confront current and future impacts of extreme heat to human health, wellbeing, and society.

**Challenges transforming evidence to policy, and poor risk communication**
Current evidence is not being translated in a timely manner to application and policy, and poor risk communication is resulting in inadequate efforts to improve public health and disaster management laws, policies and frameworks.

Furthermore, the efficacy of interventions is inadequately measured, and heat related risks remain outside many mechanisms that could prevent avoidable impacts including the disaster risk management cycle.

**System fragmentation**
Many countries and communities lack effective integrated systems and have fragmented and insufficient expertise and capacity to address the scale and complexity of current and future heat risks. Harmonization and standards are lacking in many technical areas, and the sharing of scientific knowledge and collaboration on implementation of good practices - particularly at a regional scale and across disciplines - is critical.
Recommended Action Agenda

Launch the Global Heat Health Information Network (GHHIN)

GHHIN is expected to facilitate the sharing of scientific and operational information, methods and tools for more effective management and evaluation of heat’s health effects, and to become a global resource for the dissemination of good-practice procedures.

A network approach will enable GHHIN to leverage the strengths of members, amplify solutions and impacts through peer learning; facilitate engagement and collaboration between a wide range of professions, institutions, and the public; and foster translation of local knowledge and actions into collective global knowledge and response.

Transform knowledge to action

GHHIN will accelerate the assembly and transmission of knowledge for action, through five common goals:

1. urgently improve awareness of the disaster that increasing extreme heat poses to human health, wellbeing, and productivity worldwide;
2. catalyze and sustain interdisciplinary partnerships and co-learning between research and practitioners across relevant government, academic, private sector and civil society bodies;
3. synthesize and advance science and technology available for decision making and risk reduction across sectors and time scales;
4. improve access to expert resources and opportunities for learning, exchange, and engagement;
5. identify and promote action to address critical gaps in research, knowledge and action.

Create a coordination function

GHHIN is expected to establish a coordination function to respond to the need for normative and technical guidance, knowledge sharing, and collaboration at the global and regional levels, and to support the implementation of agreed actions.

An advisory and oversight mechanism that reflects the needs and values of the network should also be established, appropriate to the agreed upon structure and mechanisms of the network.

An action plan, including key priorities, future directions and targets, should be developed by mid-2019; and the second Global Forum on Heat and Health should be organized no later than 2020 and be informed by regional or local meetings which may be organized prior.

Be inclusive

GHHIN should welcome participation from all parts of the world, all relevant research areas, and all public or private organizations working to improve individual and public health in the face of a warming world.

Ensure the Network is flexible, interdisciplinary and agile

GHHIN should be flexible, interdisciplinary and agile to adaptively learn and respond to the needs of the community. Where possible, it should draw upon existing mechanisms and structures to provide scientific and normative guidance.

GHHIN should engage and partner with key actors including WMO, WHO, the International Federation of Red Cross and Red Crescent Societies, and other international and regional bodies and professional societies, to support and engage demand driven research and action for heat risk management.

---

1. including among others, the Scientific Committee on Thermal Factors within the International Commission for Occupational Health, the World Organization of Family Doctors, the Hi-Weather Research Community, GEO Health Community of Practice, the Climate Commission within the International Society for Biometeorology; the Lancet Climate and Health Commission and Planetary Health Commissions, etc.
Leverage institutional processes to support global policy frameworks

Network partners will be encouraged to leverage institutional processes and appropriate authorities to implement the Sendai Framework for Disaster Risk Reduction 2015-2030, the Paris Agreement for Climate Change, the Global Framework for Climate Services, and the Sustainable Development Goals.

Foster research, innovation and collaboration

GHHIN will create opportunities and an enabling environment to cultivate an understanding of research and operational requirements for heat prediction and advisory, and for enhanced collaborative innovations, research, and interventions (such as support to innovation platforms, technical cooperation, sharing of good practice, novel networking approaches, personnel and scholar exchanges, pilot programming and partnerships) that will facilitate interdisciplinary learning and action at global, regional, and local levels.

Identify and address gaps

The Network will identify and advocate for action to address specific gaps in areas of occupational health, understanding and managing complex heat exposures in urban contexts, enhancing global heat prediction capabilities across timescales, evaluating intervention effectiveness, developing effective communication practices; and developing standards for collection and management of relevant health and environmental data.

Facilitate co-design and co-production of tools and information

GHHIN will adopt an integrated systems approach to facilitate the co-design and co-production of information and tools across varied disciplines. A holistic five pillar framework will guide actions of the network, under the following work streams:

- Partnerships and capacity building;
- Data, science, and research for understanding health risks of heat;
- Climate and weather information for decision-making and action;
- Effective interventions to prevent heat exposure and negative health outcomes;
- Communications and outreach.

Understand and invest in current and future needs

GHHIN recognizes that considerations across timescales are vital in all research and interventions, as is simultaneous investment to address both current and future health risks of extreme heat.
